The Arctic is a land of extremes, where winters are long and harsh, and summers are short and intense. It's a place where few humans venture, and where the landscape is still largely unexplored. But beneath the frozen ground of the Arctic lies a treasure trove of fossils, waiting to be discovered.

For years, paleontologists have been drawn to the Arctic in search of these ancient relics. They have braved the cold and the ice, and they have been rewarded with some of the most amazing fossil discoveries ever made. In the past few decades, they have found the remains of dinosaurs, mammoths, saber-toothed tigers, and even giant sea creatures like plesiosaurs.

The fossils of the Arctic tell a fascinating story about the history of life on Earth. They show us that the Arctic was once a much warmer place, with a lush and vibrant ecosystem. They also show us that the Arctic has been home to some of the most amazing creatures that have ever lived.

In the book *True North: Hunting Fossils Under the Midnight Sun*, paleontologist Jack Horner tells the story of his own experiences hunting fossils in the Arctic. He describes the challenges and the rewards of working in such a remote and unforgiving environment, and he shares his insights into the incredible fossils that he has found.

True North is a captivating and informative book that will appeal to anyone who is interested in fossils, paleontology, or the Arctic. It is a must-read for anyone who wants to learn more about the history of life on Earth.

The Arctic's Amazing Fossils

The Arctic is home to some of the most amazing fossils on Earth. These fossils include the remains of:

- **Dinosaurs:** The Arctic has yielded the remains of several different types of dinosaurs, including duck-billed dinosaurs, armored dinosaurs, and even tyrannosaurs.
- **Mammoths:** Mammoths were large, woolly elephants that roamed the Arctic during the Ice Age. Their fossils are often found in permafrost, which is frozen ground that has never thawed.
- **Saber-toothed tigers:** Saber-toothed tigers were large, powerful cats that lived in the Arctic during the Ice Age. Their fossils are often found in association with the fossils of mammoths.

- Plesiosaurs: Plesiosaurs were large, marine reptiles that lived in the Arctic during the Mesozoic Era. Their fossils are often found in the rocks of the Canadian Arctic.

The fossils of the Arctic provide a unique glimpse into the history of life on Earth. They show us that the Arctic was once a much warmer place, with a lush and vibrant ecosystem. They also show us that the Arctic has been home to some of the most amazing creatures that have ever lived.

True North: Hunting Fossils Under the Midnight Sun is a fascinating and informative book that will appeal to anyone who is interested in fossils, paleontology, or the Arctic. It is a must-read for anyone who wants to learn more about the history of life on Earth.
